Mutation in Prkag3 results in an altered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRRAG3 is useful as therapeutic for treating carbohydrate metabolism disorders suc as diabetes, obesity, and disorders associated with muscle metabolism such as myopathy and cardiovascular diseases, to modulate AMPK activity, and for restoring a normal AMPK function. PRRAG3 sequence and its functionally altered mutants are useful for the diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3, are useful for detecting a dysfunction of carbohydrate metabolism resulting from the expression of a functionally altered allele of PRKAG3.

Transgenic animal and host cell transformed with PRKAG3 or a

heterotrimeric AMPK consisting of PRKAG3 or its mutant, are useful for screening compounds able to modulate AMPK activity. Nucleic acid encoding PRKAG3 is useful for detecting mutations in a Prkag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain of PRKAG3 and is useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CGCTTCATGCAGGAGCACACCTGCTACGATGCCATGGCAACTAGCTCCAAGCTAGTCATC

The present sequence is a cDNA encoding human adenosine monophosphate

(AMP)-activated kinase (AMPK) gamma subunit muscle-specific isoform,

ENRAG3. Mutation in PrkR93 results in an altered regulation of

carbohydrate metabolism, particularly in skeletal muscle. PRKAG3 is

carbohydrate metabolism, particularly in skeletal muscle. PRKAG3 is

useful as therapeutic for treating carbohydrate metabolism disorders such

cas diabetes, obesity, and disorders associated with muscle metabolism

cutivity, and for restoring a normal AMPK function. PRKAG3 sequence

activity, and for restoring a normal AMPK function. PRKAG3 sequence

carbohydrate metabolism disorder. Primers that can detect

cand its functionally altered mutants are useful for the diagnostic

carbohydrate metabolism disorder. Primers that can detect

ca genetic polymorphic marker linked to a sequence encoding PRKAG3, are

carbohydrate metabolism disorder. Primers that can detect

a genetic polymorphic marker linked to a sequence encoding PRKAG3 or a

preferrably a carbohydrate metabolism disorder. Primers that can detect

ca genetic polymorphic marker linked to a sequence encoding PRKAG3 or a

preferrable animal and host cell transformed with PRKAG3 or a

conding PRKAG3 is useful for detecting mutations in a PrKAG3 gene, or

carbohydrate animal and conding the first cystathione beta synthase (CBS) domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 AGAATCCGTGGGAAACGGAGGCCCAAAGCCTTGAGATGGACAAAGGCAGAAGTCGGTGGAG 120

diabetes, obesity, and disorders associated with muscle metabolism such as myopathy and cardiovascular diseases, to modulate AMPK activity, and for restoring a normal AMPK function. PRKAG3 sequence and its functionally altered mutants are useful for the diagnostic evaluation, genetic testing and prognosis of a metabolic disorder, preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3, are useful for detecting a dysfunction of carbohydrate metabolism resulting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New variants of the gamma subunit of vertebrate adenosine monophosphate-activated kinase for diagnosis or treatment of disorders associated with energy metabolism such as diabetes, obesity, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is pig adenosine monophosphate (AMP)-activated kinase (AMPK) gamma subunit muscle specific isoform, PRKAG3 splice variant DNA. PrkaG3 gene is located in the RN locus of chromosome 15. Mutation in PrkaG3 seults in an allered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRKAG3 is useful as therapeutic for treating carbohydrate metabolism disorders such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rogel-Gaillard

Transpente animal and host cell transformed with PRKAG3 or a the manner and host cell transformed with PRKAG3 or a screening compounds able to modulate AMPK activity. Nucleic acid encoding PRKAG3 is useful for detecting mutations in a Prkag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain of PRKAG3 and is useful in gene therapy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 kinase regulatory gamma subunit (PRRAG3) gene. The method is used for screening animals e.g., pigs to determine those most likely to exhibit improved meat quality traits and to produce larger litters. The present sequence is pig PRRAG3 polymorphic variant DNA (PRRAG3-30).
                                                                                                                                                                                                                                                                                                         Screening animals to determine those likely to produce larger litters and improved meat quality traits involves assaying for the presence of polymorphisms in the AMP activated protein kinase regulatory gamma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ATGAGCTTCCTAGAGCAAGGAGAGAGCCGTTCATGGCCATCCCGAGCTGTAACCACCAGC

                                                                                                                                                                                                                                                                                                                                                                                                                                              those more likely to produce large litters and improved meat quality traits. The method involves assaying for the presence of a genotype in the sample of genetic material obtained from animal. The genotype is characterised by polymorphism(s) in the AMP activated protein.

The present sequence is a cDNA encoding pig adenosine monophosphate (AMP) activated kinase (AMPK) gamma subunit muscle-specific isoform, complete PRRAG3. Prkag3 gene is located in the RN locus of chromosome 15. Mutation in Prkag3 gene is located in the RN locus of chromosome 15. Mutation in Prkag3 results in an altered regulation of carbohydrate metabolism, adisorders as such as metabolism, to reaching carbohydrate metabolism disorders such as myopathy and disorders associated with muscle metabolism such as myopathy and cardiovascular diseases, to modulate AMPK such as myopathy and cardiovascular diseases, to modulate AMPK cativity, and for restoring a normal AMPK function. PRKAG3 sequence and its functionally altered mutants are useful for the diagnostic evaluation, genetic testing and prognosis of a metabolic disorder, preferably a carbohydrate metabolism disorder. Primers that can detect useful for detecting a dysfunction of carbohydrate metabolism resulting from the expression of a functionally altered allege of PRKAG3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   heterotrimeric AMPK consisting of PRKAG3 or its mutant, are useful for screening compounds able to modulate AMPK activity. Nucleic acid encoding PRKAG3 is useful for detecting mutations in a Prkag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method for screening animals to determine those more likely to produce large litters and improved meat quality traits. The method involves assaying for the presence of a genotype in the sample of genetic material obtained from animal. The genotype is characterised by polymorphism(s) in the AMP activated protein scharacterised by polymorphism(s) in the AMP activated protein thase regulatory gamma subunit (PRRAG3) gene. The method is used for screening animals e.g., piggs to determine those most likely to exhibit improved meat quality traits and to produce larger litters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       24; Length 1873;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method for screening animals to determine those more likely to produce large litters and improved meat quality traits. The method involves assaying for the presence of a genotype in the sample of genetic material obtained from animal. The genotype is characterised by polymorphism(s) in the AMP activated protein kinase regulatory gamma subunit (PRKAG3) gene. The method is used for screening animals e.g., pigs to determine those most likely to exhibit improved meat quality traits and to produce larger litters. The present sequence is pig PRKAG3 polymorphic variant DNA (PRKAG3-22).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Screening animals to determine those likely to produce larger litters and improved meat quality traits involves assaying for the presence of polymorphisms in the AMP activated protein kinase regulatory gamma

The method involves assaying for the presence of a genotype in the sample of genetic material obtained from animal. The genotype is characterised by polymorphism(s) in the AMP activated protein kinase regulatory gamma subunit (PRRAG3) gene. The method is used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                   The invention relates to a method for screening animals to determine those more likely to produce large litters and improved meat quality traits. The method involves assaying for the presence of a genotype in the sample of genetic material obtained from animal. The genotype is characterised by polymorphism(s) in the AMP activated protein kinase regulatory gamma subunit (PRRAG3) gene. The method is used for screening animals e.g., pigs to determine those most likely to exhibit improved meat quality traits and to produce larger litters. The present sequence is pig PRRAG3 polymorphic variant DNA (PRRAG3-200).
                                                                                                                                                 Screening animals to determine those likely to produce larger litters and improved meat quality traits involves assaying for the presence of polymorphisms in the AMP activated protein kinase regulatory gamma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GTAGAGGAAGGGGGCCTCCGGGCCCGAGGGAAGGTCCCAGTCCAGGCCAGTTGCTGAG

preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3, are useful for detecting a dysfunction of carbohydrate metabolism resulting from the expression of a functionally altered allele of PKKAG3. Transgenic animal and host cell transformed with PRKAG3 or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         domain

Primers that can detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a cDNA encoding pig adenosine monophosphate (AMP)-activated kinase (AMPK) gamma subunit muscle-specific isoform, parkad3 gene is located in the kN locus of chromsome 15.

Mutation in Prag3 results in a literal regulation of carbobydrate metabolism, particularly in skeletal muscle. PRKAG3 is useful as theraqeuite for treating carbobydrate metabolism disorders such as diabetes, obesity, and disorders associated with muscle metabolism such as myopathy and cardiovascular diseases, to modulate AMPK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Robic A, Rogel-Gaillard
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      activity, and for restoring a normal AMPK function. PRKAG3 sequence and its functionally altered mutants are useful for the diagnostic

uncleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides.

Concleotide of the invention, methods of detecting the nucleotides, contibudes against the polypeptides, methods of detecting the nucleotides.

Cor polypeptides of the invention. Although novel, many of the bind to polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities, stem cell growth factor activity; haematopoiesis regulatory activity; tissue growth activity; haematopoiesis regulatory activity; tissue growth activity; immunomodulatory activity; activities; the most activities; chemotactic or chemokinetic activities; haemacotactic or may be immunomodulatory activity; activities; haemacotactic or may be chromobolitic activities; receptor or ligand activities; on may be involved in oncogenesis, cancer cell proliferation or metastasis.

Computing a their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders, conditions, chromoblythy atherosclerosis, coronary heart disease, proliferative retinopathy, atherosclerosis, coronary heart disease, retarial ischaemia, bone disorders (e.g., myeloid or lymphoid called archivity, atherosclerosis, while those which replain or nucleic acids encoding them) may be used to promote wound repair (or nucleic acids encoding them) may be used to promote wound replace the and fungal infections and ulcers), while those with the polymentials in the treatment of viral, the processing the polymentials and fungal intertions in the internal process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a CDNA encoding a
                                                                                                                                                                                                                                                              Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness,
                                                            Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         novel human polypeptide of the invention.
                                                                                                                                                                                                  Claim 1; Page 429; 1963pp; English.

The sequences given in AAH43681-84 represents genomic fragments encoding the human AAP-activated protein kinase gamma 3 subunit (PRKAG3). Detecting the presence of the PRKAG3 DNA, or a variant, is useful in determining a risk setimate of a metabolic disease, such as diabetes or obesity, in a subject. The variation may occur in exons 3, 4 or 10. In exon 3 variation may be a substitution of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            useful for treating one of the above conditions. The present sequence represents a gene differentially expressed in granulocytes. Note: The sequence data for this patent did not form part
                                                                                                       Detecting granulocyte activation by detecting differential expressic of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB 24; Length 1578;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .;

XX

New nucleic acid that is a pancreatic cancer antigen for preventing, treating, or ameliorating a medical condition, particular pancreatic cancer, or for use in assays for diagnosing a pathological condition.

PT cancer, or for use in assays for diagnosing a pathological condition.

XX

XX

AAC99731 encode the human pancreatic cancer associated proteins, called pancreatic cancer antigens, given in AAB54008 to proteins, called pancreatic cancer antigens, pave cytostatic, contraceptive, nootropic, immunomodulatory, relaxant, contraceptive, cancer in gene therapy. The polyunclectide and proteins can be used for in gene therapy. The polyunclectide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays con graventing, treating, or ameliorating a medical condition or in assays consubject. Binding partners to the proteins and the activity of the proteins can be ladentified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, sepecially cancer. Agonists and antagonists to the antigens can be used to design nucleic cancer antigens proteins can be used to design nucleic cancer antigen prolynuclectides can be used to design nucleic cancer antigen prolynuclectides can be used to design nucleic and diagnostic methods. The proteins can be used to design nucleic candid Alagnostic methods. The proteins can be used to design nucleic and langisis, tissue identification and/or typing and a variety of forensic candid Alagnostic methods. The proteins can be used to purity, detect and target the polypeptides, including contin vitro diagnostic and therapeutic methods. The proteins can be used to purity, detect and target the polypeptides, including content or proteins can be used to treat or prevent neural, immune system, muscular, contents and the exemplification of the present invention.

C proteins can be used to treat or prevent neural, incompany cardiovascular, remain or concertation or the exemplif

                                                                                                                                                                                                                                                                                                                                                                     Sequence 17, Application US/09007005B
Patent No. 625858
GENERAL INFORMATION:
APPLICANT: SZOSTAK, Jack W.
APPLICANT: SZOSTAK, Jack W.
APPLICANT: LIU, Rihe
TITLE OF INVENTION: ELECTION OF PROTEINS USING RNA-PROTEIN
TITLE OF INVENTION: EVISIONS
FILE REFRENCE: 00786/150003
CURRENT APPLICATION NUMBER: US/09/007,005B
CURRENT FILING DATE: 1998-01-14
EARLIER APPLICATION NUMBER: 60/055,963
EARLIER PILING DATE: 1997-01-27
EARLIER PILING DATE: 1997-11-06
NUMBER OF SEQ ID NOS: 33
SOFTWARE: FASISEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 289;
